

Angular Test

1. Open “AngularTestProject” folder in VS Code or Visual Studio Community edition, and code as per below instruction
2. Add a login component to the App module
3. On application start it should show the login page
4. Add labels and fields to the Login page for user name and password, and add a login button
 1. User name: input
 2. Password: input
 3. Login button
4. Login area should align center of the page in all screen sizes
5. Use Angular reactive forms
6. Add a service named “loginService” and a method that takes username and password as inputs and return Promise of type ILoginResult as below.

```
export interface ILoginResult {  
  loginSuccessful: boolean;  
}
```

NOTE: No need to code API or Database

7. Validate username and password and display validation message under input
8. Call loginService’s login method on Login button click
9. Code the test and return the folder in zip, exclude/delete “node_modules” folder before zipping it – this is to reduce size of the zip
